

IT314 - Software Engineering

Lab Assignment - 6 :- Requirement Formalization & Process Modeling

1. Background

Your project has, by now, moved through identifying stakeholders and end users, choosing elicitation technique(s) for each of them, and applying those techniques to gather requirements. In practice, this work rarely finishes all at once elicitation with some stakeholders may be complete, while others are still ongoing, and your requirement set may still be evolving as a result. That is expected and normal in an iterative process.

This assignment asks you to pull together everything your group has produced so far along this thread stakeholders, elicitation, and the requirements derived from it into one coherent document, and to model one significant piece of your system's behaviour as an activity diagram.

2. Task

2.1 Stakeholders & Elicitation

Present the stakeholders/end users you identified, and the elicitation technique(s) chosen for each. For each stakeholder, indicate where things currently stand elicitation complete, in progress, or not yet started along with whatever you've gathered so far. If parts are still ongoing, say so plainly and explain the current work, what remains and how you plan to close it out.

2.2 Requirements Documentation

Based on the elicitation carried out so far, consolidate your requirements into a single, clearly organized document covering:

- Functional Requirements (FRs)
- Non-Functional Requirements (NFRs)
- Domain Requirements

Where elicitation for a stakeholder is still ongoing, the requirements drawn from it may naturally be partial or provisional include them as such rather than waiting for everything to be finalized. You are free to decide how to structure and present each requirement (e.g., whether to assign IDs, indicate priority or status, or trace a requirement back to its source stakeholder/technique). Choose an approach that communicates your requirements clearly, and be ready to justify your choices.

2.3 Activity Diagram

Pick one major piece of functionality/implementation from your project — something substantial enough to involve multiple steps, actors, or decision points. Draw an activity diagram that models how this functionality actually flows: the actions, decision points, and (where relevant) parallel or alternate paths involved.

- The choice of functionality is entirely up to your group.
- The diagram must be hand-drawn. Submit a clear photograph or scan of it.

3. Deliverables

- A document covering your stakeholders, the elicitation technique(s) used for each (with status - completed/ongoing), and the Functional, Non-Functional, and Domain requirements derived so far.
- One hand-drawn activity diagram (submitted as a clear photograph/scan) for a major implementation of your choice.

**** Submission is per group.***
